Common Topsoil Questions

Topsoil for healthy gardens and lush lawns.

What is Topsoil?

Topsoil is the rich outermost layer of soil, usually 2-8 inches. It contains organic matter, micro-organisms and worms which give the soil the nutrients to help things grow.

Why use topsoil?

If you have an area with poor soil quality and you'd like to grow grass, plants or a garden there, topsoil will be necessary to help a solid root base develop and grow.

How much topsoil do I need? Healthy lawns need about 6 inches of topsoil to thrive. Measure the area that you would like filled.

Take the length, width and depth and multiply them together to get a cubic quantity. For example if you want to fill a garden that is 10ft X 10ft X .5ft = 50 cubic feet. There are 27 cubic feet in one cubic yard. To turn cubic feet into cubic yards divide by 27. So one would need 1.85 cubic yards to fill the garden.

How much does Topsoil weigh?

Generally, 1 cubic yard of topsoil weighs about 1 ton or 2000 lbs.

What is the difference between fill dirt and topsoil?

Fill dirt is used to fill in large areas and may contain rocks. Topsoil is the final layer place down on top of the fill to get grass to grow. Topsoil is generally screened free of

rocks and large debris and contains more nutrients to help things grown.

Interested in topsoil in the Orange County, NY area including Warwick, Goshen, Monroe, Middletown, Newburgh? Contact Ground Control Excavating for more info. 845-661-8118
